

TruSecure® Service Provider 2001

Groundbreaking Security Assurance for Service Providers

As the demand for managed services has grown dramatically, so has the focus on the security of those services. Customers, the media and analysts have devoted increased attention to the security issues posed by reliance on managed service providers.

TruSecure Service Provider 2001 is designed to meet the unique security needs of service providers: effectively securing their environment, differentiating themselves from competitors and inspiring confidence in their current and prospective customers.

TruSecure Service Provider's Comprehensive Program

TruSecure Service Provider is the only solution that provides independent testing and verification of all the dimensions of a service provider's offerings. The program addresses the security surrounding the supporting Data Center or Network Operations Center and enables service providers to continuously maintain and improve their security posture. TruSecure Service Provider includes:

- Electronic assessments of core router and management stations
- Physical security review: policies, procedures, architecture
- TruSecure Risk Monitor, including a constantly refreshed database of security risks, and real-time alerts around emerging risks
- Evaluations and recommendations on overall network architecture and connectivity, including backup/failover systems, redundancy and environmental controls
- Validation of policy compliance in human resources, Internet security, administration, remote access, helpdesk and physical security.

Additional modules are available to support the needs of providers of specific services, such as **Managed Firewall Certification** and **Dedicated Hosting Certification**—the first security assurance programs designed specifically for these segments.

TruSecure Service Provider 2001 Advantages

TruSecure Service Provider offers a number of compelling advantages over other security solutions:

- **Independent certification.** TruSecure certification provides independent validation of a sound security infrastructure by a leading authority in information security. Many TruSecure Service Provider clients find they can reduce the number of costly and distracting due diligence visits from prospective customers.
- **Outsourced security intelligence.** TruSecure's Risk Recon Team leverages an unparalleled intelligence and analysis network to keep clients' operations staff one step ahead of emerging threats. TruSecure's ICSA Labs division facilitates the leading ISP consortium, ensuring that TruSecure clients are always up-to-date on the state of security practices of service providers.

TruSecure® Service Provider 2001 Groundbreaking Security Assurance for Service Providers

"It was a logical step for us to seek TruSecure certification—the gold standard of security validation—to demonstrate to our customers Unisys' unflinching commitment to ensuring the most stringent security when delivering managed network services," Unisys Corporation

(Advantages continued)

- **Competitive differentiation.** Many TruSecure certified clients actively feature their certification in advertising, collateral material and on their website, in order to demonstrate their commitment to sound security.
- **Centralized security management.** With TruSecure's new patent-pending Risk Manager console, security for an extended network of operations centers can be centrally tracked and managed. The console shows the certification status, outstanding tasks, vulnerabilities, and more key information—from the operations center down to the device level.
- **Better ROI on security investment.** TruSecure helps organizations better leverage the people and products already in place, yielding greater risk reduction per dollar spent on security. TruSecure's fixed price solution provides a more predictable, cost-effective approach than an open-ended, billable-hours model.

Powered by Unmatched Expertise of ICSA Labs

TruSecure Service Provider is backed and supported by the experience and expertise of the ICSA Labs, a division of TruSecure Corporation. The ICSA Labs is the security industry's central authority for product research, testing and certification. The ICSA Labs sets performance standards for information security products and certifies over 95% of the installed base of Anti-Virus, Network Firewall, IPSec and Cryptography products. This unparalleled body of knowledge provides TruSecure with a unique ability to help organizations cost-effectively secure their Internet-connected systems and data.
